

Experiment: Digital Forensic Investigation Report using Python

Aim

To simulate the stages of a digital forensic investigation and generate a simple forensic report using Python.

Algorithm (5 Points)

1. Create a dictionary containing the stages of digital forensics and their corresponding details.
2. Print a report heading.
3. Traverse the dictionary using a for loop.
4. Display each forensic stage along with its description.
5. Generate the complete digital forensic investigation report.

Python Code

```
report = {  
    "Identification": "Evidence Collected",  
    "Preservation": "Evidence Preserved",  
    "Collection": "Disk Image Acquired",  
    "Examination": "Files Analyzed",  
    "Presentation": "Report Generated"  
}
```

```
print("\nDigital Forensic Report\n")
```

```
for stage, detail in report.items():
```

```
    print(stage, ":", detail)
```

Sample Output

Digital Forensic Report

Identification : Evidence Collected

Preservation : Evidence Preserved

Collection : Disk Image Acquired

Examination : Files Analyzed

Presentation : Report Generated

Result

The program successfully simulates the stages of a digital forensic investigation and generates a simple digital forensic report by displaying each investigation stage along with its corresponding activity.
